Westinghouse

Greetings,

I am a QA/Automation developer. I possess a Bachelor's and Associate's in Computer Science. I have prior experience performing quality assurance with systems utilizing micro services. After browsing Indeed.com for opportunities in a position I can provide my expertise in, I ran across your opening for a Systems Analyst.

While working at GlobalLogic, I wrote tests against many different services. I crafted curl requests to validate event logs on splunk. I contributed to the team's automated test suite, that ran automated tests against their web application. I was responsible for assisting leadership with executing and interpreting stress tests against different services within the system being developed. I possess both the Security+ and the AWS CCP certifications and intend to continue obtaining certifications. While they were not related to my duties with GlobalLogic, I studied and passed these as a means to display my broad capacities in the field of computer science.

I am hungry for a challenge. I will be the man you call to have 110% present to solve your problems with passions and completeness. I am familiar with most of the technologies described in your job posting. I have written personal applications with MySQL and could transition my experience to understand Oracle SQL and MongoDB. My previous job used Spring Boot to manage all of the micro services. I am currently writing this cover letter using Linux Mint running in a VM. I could invest my onboarding time to understand WebLogic.

I wish nothing more than to provide you with the highest excellence and quality assurance for you. I hope to hear from you to discuss how we may move forward.

Sincerely,

Cole Kendall
